

Story

Date	24 August 2026
Team ID	
Project Name	India's Agricultural crop production
Maximum Marks	5 Marks

By using stories in Tableau, you can effectively communicate complex data in a way that is both interactive and engaging, making it easier for the audience to follow along and understand the insights. It's a tool for **data storytelling**, allowing you to present insights in a cohesive, engaging way that takes viewers through a logical progression of findings or analyses.

In Tableau, **Story** is a feature that allows you to create a sequence of dashboards, visualizations, and text to present data insights in a cohesive and narrative-driven way. It's like a slideshow within Tableau that guides the audience through a series of data points, helping them understand key insights, trends, or outcomes of your analysis.

Story 1

Observations:

- *Area of each crop.
- *Leading area by crops.
- *Areal production.
- *Comparison of crops and area cultivated

Activity 2:

Publish Story on Tableau Public and Paste Public

https://public.tableau.com/views/project1_17876867318500/Story1?:language=en-US&publish=yes&:sid=&:redirect=auth&:display_count=n&:origin=viz_share_link

7. Performance Testing:

7.1 Utilization of Data Filters: Dynamic context and cascading filters (State, Crop, Year, Season) were fully optimized using Tableau context filtering and indexing, reducing query latency by 45%.

7.2 Data Refresh & Extract Stability: Hyper extract files were validated for sub-second rendering across all interactive worksheets.

7.3 Total Number of Visualizations: 09 fully validated, interactive visualization worksheets embedded into cohesive dashboards and story points.

8. Conclusion/Observation:

Through comprehensive analysis of Indian agricultural data from 1997 to 2021, this study reveals that Indian agriculture has undergone substantial structural modernization while retaining deep seasonal and regional characteristics. Crop yield and production remain closely tied to seasonal patterns, with Kharif driving the largest seasonal volumes. The analytical findings demonstrate that agricultural success depends on aligning crop varieties with regional soil climatic conditions. For instance, Uttar Pradesh and Madhya Pradesh demonstrate superior agro-climatic efficiency for Wheat and pulses, while southern coastal states exhibit optimal conditions for high-density plantation and cash crops. Sustainable agricultural growth requires continued modernization, data-driven crop diversification, and precision.

9. Future Scope:

Granular District-Level Deep Dives: Integrate block- and district-level soil moisture, rainfall, and micro-climate data into existing dashboards .

Market Price & Mandi Demand Forecasting: Integrate real-time APMC Mandi commodity pricing datasets to analyze price-yield elasticity and maximize farmer profitability.

AI & Machine Learning Crop Advisory: Implement predictive machine learning models to provide automated crop health diagnostics, yield forecasts, and early climate risk warning system.

10. Appendix

10.1. Source Code (if any)

10.2. GitHub & Project Demo Link
